Unit 9 - Creating Interactive Dashboards in Tableau

- Introduction
  - The era of big data has transformed how organizations analyze and interpret information, making dashboards an essential tool for data-driven decision-making.
  - Dashboards serve as a dynamic interface for exploring, visualizing, and understanding complex datasets.
  - This chapter focuses on the step-by-step process of creating dashboards, starting with individual charts and integrating them into interactive dashboards.
- Interactive Dashboards - Definition
  - Interactive dashboards in Tableau enable users to visualize, explore, and analyze data dynamically.
  - Unlike static reports, they provide interactivity through filters, highlights, and tooltips, combining multiple visualizations and metrics into one interface.
  - This interactivity transforms dashboards into decision-making tools, allowing stakeholders to uncover insights.
- Building Dashboard for Data Exploration
  - Step 1: Creating a New Dashboard
    - Access the Dashboard Workspace by locating tabs at the bottom of the Tableau workbook and clicking the New Dashboard icon.
  - Step 2: Adding Views to Your Dashboard
    - Use the left panel's Sheets list to identify views and drag them into the dashboard workspace.
  - Step 3: Arranging and Replacing Sheets
    - Position and resize views within the dashboard layout, and replace sheets easily without losing settings.
- Adding Interactivity to Dashboards in Tableau
  - Techniques to enhance interactivity include using sheets as filters and adding dashboard actions.
    - Using Sheets as Filters allows a visualization to filter data in other sheets when users interact with it.
    - Adding Dashboard Actions creates advanced interactivity to link multiple sheets or integrate external content.
- Combining Multiple Charts into Interactive Dashboards in Tableau
  - Step-by-step guide on integrating various charts to create a cohesive interactive dashboard.
    - Create individual sheets, open the dashboard workspace, and drag/drop visualizations while adding interactive elements like filters and actions.
- Summary
  - This chapter emphasizes the importance of building effective dashboards, integrating multiple visualizations, and enhancing interactivity with filters and actions for improved data exploration.
- Dashboard Actions
  - Dashboard actions like filter actions, highlight actions, and URL actions create interactivity across multiple views.
    - Using a Single View to Filter Other Views allows selection in one view to filter data in related views.
    - Navigate to sheets using the Go to Sheet action to enhance user navigation.
- Highlights
  - Highlights emphasize specific data points or relationships, enhancing focus and improving exploration.
    - Highlight actions allow users to select marks and see related data highlighted in another visualization.
- Adding Interactivity with Filters
  - Filter actions communicate between worksheets, transferring data values to refine views based on selections made in one visualization.
  - Steps to create or edit a filter action involve navigating to the actions menu, specifying source and target sheets, and setting trigger conditions.
